#### Introduction

In 1999, the National Park Service (NPS) launched the Natural Resource Challenge, a 5-year program designed to strengthen natural resource management in the nation's national parks (National Park Service 1999). The single biggest undertaking of the Challenge was to expand ongoing park inventory and monitoring efforts into an ambitious comprehensive nationwide program. The Service-wide Inventory and Monitoring (I&M) program was introduced to 270 parks identified as having significant natural resources. Under this program, parks have been organized into 32 networks to conduct long-term vital signs monitoring. Each network links parks that share geographic and natural resource characteristics, allowing for improved efficiency and the sharing of staff and resources.

The Upper Columbia Basin Network (UCBN) includes nine national park units with significant natural resources in Idaho, Montana, Oregon and Washington. The parks in the Network include: Big Hole National Battlefield (BIHO) in Montana; City of Rocks National Reserve (CIRO) in Idaho: Craters of the Moon National Monument and Preserve (CRMO) in Idaho; Hagerman Fossil Beds National Monument (HAFO) in Idaho; John Day Fossil Beds National Monument (JODA) in Oregon; Lake Roosevelt National Recreation Area (LARO) in Washington; Minidoka Internment National Monument (MIIN) in Idaho; Nez Perce National Historical Park (NEPE) in Idaho, Montana, Oregon, Washington; and Whitman Mission National Historic Site (WHMI) in Washington.

This report on the availability of fire information in the UCBN addresses a need of the monitoring program to summarize existing information concerning park natural resources and identify the most significant resources and resource threats for each park across the network. The purpose of this project was to locate current and historic fire data associated with the UCBN parks and to provide access to this data to aid in project planning and decision-making.

Fire is a powerful force that has had, and will continue to have, a profound influence on NPS lands. Fire management decisions within the NPS require information on fire behavior and on the effects of fire on park resources (National Park Service 2003). In addition, information on fire severity and frequency are necessary to meet several goals of the NPS I&M program including to better understand the dynamic nature and condition of park ecosystem, to provide reference points for comparisons with other altered environments, and to meet certain legal and congressional mandates related to natural resource protection. Knowing the condition of natural resources in national parks is also fundamental to the Service's ability to manage park resources unimpaired for the enjoyment of future generations (http://science.nature.nps.gov/im/monitor/ysmAdmin.htm).

#### Methods

The first step in this project was to initiate a scoping process to determine the *Who, What, Where, When,* and *Why* of fire information available. The scoping process included generating a list of important questions for this report to answer. The questions included:

• Who are the contacts for the available Network fire information?

- What type of fire information has been collected and recorded in the past and will be collected in the future?
- Where is the fire information for UCBN parks stored?
- When are the data collected annually, every five years, etc.?
- Why are the data collected? Is there management objectives associated with the collected information?

Resource managers in the nine UCBN park units were contacted and asked to send any fire information that they had in the park (including fire management plans), provide NPS or other agency contacts for additional fire information, and provide information of other depositories that they knew stored fire information for their park (see Appendix A for contact information). The park contacts identified several outside sources for park fire information including; United States Forest Service (USFS), Bureau of Land Management (BLM), North Cascade National Park, Pacific West Region offices, and several sources at the University of Idaho and Oregon State University libraries. Information was also located on the Internet at many different sites.

After the scoping process was complete, the task of collecting information began. Any data that was stored electronically and available for transfer was obtained via E-mail attachment or download. Hard copy information had to be mailed or picked up in person from the sources.

The final step in this project was to compile the information and summarize what data was found, who has it, what was actually collected, where the data was collected from, when and why the data was collected, and where it can be located. Due to the time frame of this project, some data may not be collected by the conclusion of this report. This data will be identified and a description of where the data is and a contact will be provided.

#### Results

#### Time Line of Policy Change

While some NPS units began fire monitoring as early as 1978, most did not. However, after the 1988 fires in Yellowstone NP, there was a strong push for monitoring the effects of fires. This led to the creation of the Fire Monitoring Handbook. On paper, the monitoring program was fully implemented in the Western Region in 1990. In 1996, NPS adopted the Fire Monitoring Handbook which outlined specific monitoring protocols and standards. In 1998, Directors Order 18 directed managers to have a Fire Management Plan and monitor all prescribed and wildland fires. That same year Reference Manual 18 came out further explaining the fire management guidelines of Directors Order 18 (National Park Service 1999). As a result of these past events there should be current Fire Management Plans and monitoring data for all parks that have experienced wildfire and/or have prescribed burning projects. Unfortunately, this is not the case for parks in the UCBN.

Fire data prior to the adoption of the Fire Monitoring Handbook in 1996, is hard to find and non-existent in some cases. For the parks that experienced wildfires in the past, fire report forms were filed that contained basic fire information (see Appendix B). These reports were previously entered into the Shared Applications Computing System (SACS). In 2004, this computer system changed to the National Fire Plan Operations & Reporting System (NFPORS), an interagency

application to report accomplishments for the National Fire Plan. All wildfires are entered into NFPORS. Many of these reports can be found on the National Fire and Aviation Management Web Applications (FAMWEB) site (<a href="http://famweb.nwcg.gov/">http://famweb.nwcg.gov/</a>) under US federal wildland fire management data. Data included in these reports are: date of occurrence, date controlled, size of fires, GPS location coordinates, land owner, agency responsible, initial attack forces, and person filing report. Users of this site must keep in mind that the records do not contain all the past fires. This is due to the loss of some old hard copy fire reports or inconsistent entries into the electronic reporting systems. Fire report data from other agencies having fire suppression responsibilities on NPS lands can be found in this data as well. The data have an origin code that correlates to the landowner where the fire started. Fire report data exist for approximately 220 fires in UCBN parks dating back to 1964 at CRMO (Table 1).

Table 1. Fires from 1964-2004 that originated within UCBN park boundaries. Any fires that burned in the parks but originated outside of the park boundaries are not represented. All fires where the BLM had fire jurisdiction are represented on the chart. The Forest Service also has fire suppression jurisdiction on some park lands, but those fires are not included in this chart due to differences in the data file formatting. Note that Minidoka Internment NM is not included.

### Prescribed Fire

Four parks in the network BIHO, JODA, LARO, and WHMI have active prescribed burn programs. Copies of several burn plans were received at the time of this report from these parks (Table 2). Several of the plans from LARO are silviculture plans that involved both slashing and burning.

Table 2. Park units with available burn plans including the year and acreage of the area burned.

Park	Year	Project	Acres
JODA	1999	Windy Point Rx burn	1740
JODA	2001	Picture Gorge Rx burn	845
JODA	2002	Sand Mtn burn	1780
JODA	2002	Middle Mtn burn	895
JODA	2004	Rock Creek Burn	1100
WHMI	2004	WHMI Rx plan	98
LARO	2003	Bradbury Beach slash&burn	24
LARO	2003	Water Tank slash/burn	43
LARO	2003	Porcupine/Laughbon slash/burn	35
LARO	2003	Marcus Island slash/burn	49
LARO	2004	Rx Plan Gifford unit	67
BIHO		At least 4 burn plans not received	

The Pacific West Region fire ecologist based at North Cascade National Park oversees the monitoring of fire effects plots at JODA, LARO, and WHMI using the monitoring protocol and data collection forms from the Fire Monitoring Handbook

(<a href="http://www.nps.gov/fire/fire/fireco\_firemonitoring.html">http://www.nps.gov/fire/fire/fireco\_firemonitoring.html</a>). The plot data is stored in a Microsoft ACCESS database called Fire Ecology Assessment Tool (FEAT), and will soon be available on an internal, read-only NPS FTP site (see Table 5). The fire ecologist responsible for compiling the fire data from the fire effects plots in these parks at the time of this report is Karen Kopper (Appendix A).

#### Spatial Data

Perimeters of fires from 1981-2003 were acquired in spatial format from Region 4 of the USFS. The polygons were assembled from digitized maps, GPS data, and photos. After analyzing the data, it was apparent that fire data inside the boundaries of network parks was not available until 1996, the same year the NPS Fire Monitoring Handbook was adopted. Figure 1 shows the fires that have been mapped in and around the network parks. Not all the fires that have occurred are represented in this data due to bad record keeping of past fire perimeters. Compilation of the available data from within park service units from 1996-2003 is shown in Table 3. For any updates to this data contact David Prevedel, Information Systems Specialist (Appendix A).

The Interior Columbia Basin Ecosystem Management Project (ICBEMP) compiled fire origin data including start location, acres burned, and fire causes from 1986 to 1992. Based on this data, 135 fires occurred in UCBN parks burning approximately 6660 acres (Table 4). When comparing this table to the other tables with similar data in this document, it is clear that there are some discrepancies in the number of fires and acres burned per year. These differences even occur in recent years. This would indicate that a better method of recording fire occurrence and acres burned needs to be created so the fire history data is more accurate in the future.

Table 4. Fires originating in UCBN parks, acres burned and fire causes from 1986 to 1992,

based on the Interior Columbia Basin Ecosystem Management Project.

## Online Resources

Several online resources were found that could provide useful data to park resource managers, fire specialists, and researchers. Table 5 lists the internet address of each site containing Network fire information and provides a brief summary of the information found at each address.

#### Fire Monitoring Today (2005)

Current monitoring standards in the park units are outlined in the Fire Monitoring Handbook. The Fire Monitoring Handbook was created in 1988 but was not adopted by the National Park Service until 1996. The handbook provides a system to document burning conditions and fire behavior, insure fires remain within certain conditions, verify completion of burn objectives, and follow long-term trends. This information can help managers in burn prescription refinement when objectives are not met, identify long-term undesirable trends, and to identify research needs (http://www.nps.gov/fire/fire/fir eco firemonitoring.html). The guidelines set forth in the Fire Monitoring Handbook are now the minimum standards for monitoring. The goals of the National Fire Monitoring Program are to record basic information for all fires, document immediate post-fire effects of prescribed burns, share information among land managers, follow trends in plant communities where fire research has been conducted, and identify future research needs. The program recognizes four basic levels of monitoring variables; environmental, fire observations, monitoring variables, and long term change (Table 6). The program also recommends different standards of monitoring for three different fire management strategies. Monitoring levels 1 and 2 are recommended for suppression, wildland fire use, and prescribed fire while all 4 levels are recommended for prescribed fire.

Table 6. The 4 fire monitoring levels identified by the National Park Service for the fire

monitoring program.

monitoring	71 0		
Level	Title	Description	Variables
Level 1	Environmental (Planning)	Fire Planning data provides the background for decision making.	Weather, Fire danger rating, Resource availability, Values at risk, Baseline inputs for fire decision making technologies, Repeated inventories
Level 2	Fire Observations	Reconnaissance monitoring: basic overview of the fire.  Fire condition monitoring: Monitoring over the time of the fire.	Cause, location, size, fuels, activity, spread potential, weather, smoke, and safety issues.  Monitoring period, topographical variables, behavior, Smoke, fuels, and Weather.
Level 3	Monitoring Variables	Monitoring variables in three different cover types.	Grass land transects, Brush plots, Forest Plots
Level 4	Long Term Change	Continued monitoring of all level 3 variables.	

#### Summary of Fire Monitoring in Network Parks

#### City of Rocks National Reserve (CIRO)

The monitoring information available for CIRO is from the CIRO 1994 Fire Management Plan. When the updated version (currently in review) is complete and available it will have the current monitoring standards for CIRO. According to the 1994 plan, the Pacific Northwest Region would be notified as soon as possible of all wildfire activity. A Fire Report DI-1202 would be completed for all wildland fires by the incident commander prior to release from the fire. Currently there is a fire history project being done in the park. This project is scheduled to be completed in the fall of 2005. The updated Fire management plan should address the new standards of fire monitoring but, at this time the fire monitoring is not being done to current policy.

#### Craters of the Moon National Monument and Preserve (CRMO)

The fire monitoring program for CRMO follows the guidance of the Fire Monitoring Handbook. The focus of this monitoring program is to study big sagebrush plant associations and cheatgrass response according to the 2000 CRMO Fire Management Plan. The reason for monitoring is to

verify current fire ecology research throughout the monument, and to monitor the invasion of exotic species. The level of monitoring will be determined by current and predicted fire behavior. Large active fires will require qualified fire monitoring technicians, recording fire weather readings onsite, estimating fire behavior parameters, noting fire effects, determining fuel moisture levels, and documenting fuel type fire behavior with photographs. The 2000 Fire Management Plan has been collected by the UCBN along with a table of fires from 1984-2003 (see Appendix C) and data from two vegetation plot surveys. To accurately compare change of vegetation from pre to post fire it would be good to have documented the vegetation prior to burning. Without this data it is hard to make the comparison and measure the cheatgrass response as stated in the Fire Management Plan objectives.

# Hagerman Fossil Beds National Monument (HAFO) and Minidoka Internment National Monument (MIIN)

These parks are managed by the Superintendent of HAFO and so operate under the same fire management plan. The current 2001 HAFO plan does not show this, however the next revision will incorporate MIIN. The focus of this monitoring program is to study big sagebrush plant associations and cheatgrass response when prescribed fire is used in the Monument. This objective is very similar to CRMO's with the same issue that there is a lack of pre-burn vegetation data for comparison. The monitoring design is as described in the National Fire Monitoring Handbook. Monitoring will be associated with prescribed fire projects in the Monument and the cost of these projects will include the cost of monitoring within the project area and up to three years after the project is completed. Data will be entered, checked for errors, and managed by the fire effects monitoring staff at North Cascades National Park. At the time of this report North Cascades was not aware of this responsibility. Original copies of all data will be kept in the office of CIRO. CIRO has not received any fire data from HAFO at the time of this report. Copies of all data will be filed in North Cascades fire management office and will be made available to HAFO staff by December first of that year.

#### John Day Fossil Beds National Monument (JODA)

Prescribed fire will be used for hazard fuel reduction, maintenance of historic landscapes, and ecosystem management. The intent of monitoring prescribed fires at the monument is to provide information for quantifying and predicting fire behavior and its ecological effects on the monument resources while building a historical record. Monitoring measures the parameters common to all fires: fuels, topography, weather and fire behavior. In addition, ecological changes over time, such as species composition and structural change, will be monitored for several years after a fire. JODA will use the fire monitoring protocols developed by the Fire Monitoring Handbook and adapted for use in the monument. A fire monitor will be assigned to collect all information and complete the necessary forms prior to, during, and after the burn. Records will be archived in the monument's fire records for future use and reference. The UCBN has collected four burn plans from 1999 to 2003 as well as the current (2003) Fire Management Plan.

#### Lake Roosevelt National Recreation Area (LARO)

Monitoring will be a part of all prescribed burns conducted in LARO. Monitoring will help to define the effectiveness of the fire management program by assessing the vegetative effects of fire using the monitoring protocols outlined by the Fire Monitoring Handbook. The fire

ecologist for the North Cascades National Park Service Complex is responsible for pilot sampling, monitoring crew supervision, data entry, management, and analysis. This person is also responsible for annual reports and data analysis. The North Cascades Fire Effects Monitoring Crew will carry out data collection and data entry with assistance from Lake Roosevelt staff when possible. The North Cascades Fire Ecologist and the Regional Fire Effects Monitoring Coordinator are responsible for management plan revision and annual monitoring program review. The UCBN has collected the most recent Fire Management Plan, monitoring report for the Evans Rx unit, Rx plan for the Gifford Unit, 4 slash and burn plans, and the slope analysis of potential burn areas.

Nez Perce National Historical Park (NEPE) and Big Hole National Battlefield (BIHO) Park personnel are responsible for keeping records of fires and completing an annual report on fires and fire effects in the park. All fires will be reported using a DI-1202 and entered into the SACS, now National Fire Plan Operational Reporting System (NFPORS), within 10 days. The fire monitoring plan is not present in the 2000 version of the Fire Management Plan so there is not much information on monitoring in the parks. Mitch Burgard, at the time of this report, is writing the Rx burn plans for BIHO (see Appendix A). The old plans prior to the year 2000 were done by Diane Hutton (see Appendix A). Copies of the Rx plans are being collected by the UCBN.

### Whitman Mission National Historic Site (WHMI)

Fire monitoring will be done in accordance to the Fire Monitoring Handbook. Prescribed fire plans will be completed prior to burning and filed at the park. Following the burn, the Chief of Interpretation & Resource Management will complete a fire monitoring report that summarizes weather and fire behavior observations in relation to ignition operations and any initial observations of first order fire effects. That person will also prepare an Individual Fire Report, DI-1202, and update the National Fire Plan Operational Reporting System within ten days after the fire. The park staff will maintain a project file that includes the burn unit plan, spot weather forecasts, and all required reports. Long-term evaluation of how successful the burn was in achieving burn plan goals and objectives will be conducted by park staff and Fire Effects Monitoring staff from North Cascades National Park. Twenty DI-1202 report forms have been collected for both wildfire and prescribed fire at WHMI between 1982-2004.

#### Conclusion

Since 1996, there have been roughly 100,670 acres burned naturally in and around the park of the UCBN (USDA Forest Service 2003). This figure is not inclusive of the acres burned during prescribed fire events which are extremely variable from year to year. When comparing available fire data however, it is clear there are some discrepancies in both the number of fires and acres burned per year. This would indicate that a better method of recording fire occurrence and acres burned needs to be created so the fire history data is more accurate in the future.

Sound fire management plans, coupled with the guidance from the Fire Monitoring Handbook, will give rise to monitoring information both accurate and available for land managers and researchers. The bottom line is, without monitoring data collected over time, land managers

have no hard evidence that what they are doing is meeting the management objectives. Currently there is a significant lack of pre-burn data. Post-fire data has been collected in some areas, but this only tells what has happened after fire and is really only telling part of the story. To facilitate monitoring managers must take a more active role in instigating the monitoring effort. In many cases monitors come from outside the park level. These monitors can only measure what they know about. Some pre-planning on the park manager's part to inform and schedule with the monitors could resolve some of the lack of monitoring. It is also fair to say that once monitoring has occurred the data should be processed and returned to the manager in a timely manner to measure success and use for any future projects.

It is important that managers know where to access information that has been collected from fire events in their parks and that this information is accurate. Today, land managers are becoming increasingly accountable for their decisions. Accurate, timely, and uniformly-gathered data is crucial for obtaining trend information on the health of the land and the effects of fire on park resources as well as facilitating information exchange among parks and providing documentation and databases useful for refinement of the park fire management programs (National Park Service 2003, National Wildfire Coordinating Group 2005).
